Programming for Everyone

Module 1

Lists, loops and functions

March 9, 2026

PART 1

First steps

The interpreter

Python answers every line:

```python
fruits = ["apple", "banana", "cherry"]
for fruit in fruits:
    print(fruit.upper())
```

> **Note.** A `for` loop visits the items in order.

Example 1.1 — A shopping list

Add up the prices of a shopping list.

Solution. The built-in `sum` adds the items of a list:

shopping.py — Python

```python
prices = [2.50, 1.20, 3.80]
total = sum(prices)
print(total)
```

Output

```
7.5
```

Exercise 1.1 — A function

Write a function that returns the largest item of a list.

> **Tip.** Python has `max`, but try writing it with a loop first.

Thank you!
